Border Gateway Protocol (BGP) is the routing protocol used to exchange routing information across the Internet. It makes it possible for ISPs to connect to each other and for end-users to connect to more than one ISP. BGP is the only protocol that is designed to deal with a network of the Internet's size, and the only protocol that can deal well with having multiple connections to unrelated routing domains. This book is a guide to all aspects of BGP: the protocol, its configuration and ...

BGP is relevant to network administrators of large organizations which connect to two or more ISPs, as well as to Internet Service Providers (ISPs) who connect to other network providers. If you are the administrator of a small corporate network, or an end user, then you probably don't need to know about BGP.

Understanding BGP : networking - reddit

Routing Protocols (such as BGP, OSPF, RIP, EIGRP, etc...) are designed to help routers advertise adjacent networks and since the internet is a network of networks, BGP helps to propagate these networks to all BGP Routers across the world. BGP is defined by IETF in RFC 4271 and we are currently on version 4 (BGP4 or BGP-4) since 2006.
