(If not most) liquid-cooled engines must ultimately pass the heat to the surrounding air. The liquid coolant is used as an efficient heat transfer fluid around the hottest parts of the engine, but the heat must be removed from the coolant to allow it to be “recycled”, returning to the engine to do its job once more.

If you don't see any flow, with engine running try the hose where it goes to the heater core to see if there is any air trapped, starting at the engine out end and work back along and see how you go. It may be worth installing a bleeder in the line between the two heater cores to eliminate any air whenever the cooling system is drained and filled.

I have a 3406b in a peterbilt. No cab heat at idle
