One of the most effective waste minimization programs that can be established is the active life-cycle management of hazardous materials before they become hazardous waste. The active life-cycle management program provides procedures that allows hazardous material users the option to extend the life of certain hazardous materials after their shelf life term has expired.

It is well known that fluorescent light bulbs and consumer appliances such as televisions, computers, and monitors contain mercury, dangerous chemicals, and other harmful components. The existing literature on hazardous materials addresses the risks attached to specific materials and emphasizes compliance and personal protective equipment (PPE) but

The Hazardous Material Life-Cycle Cost (HMLCC) Model was developed to estimate the total life-cycle costs of using various hazardous materials in the construction, maintenance, and repair of U.S. Naval systems and facilities. The model estimates those costs derived from the need to protect the health and safety of workplace personnel and the need to protect the environment. The purpose of this guide is to provide the system manager detailed instructions on how the HMLCC model operates and how to provide the model with cost information. ... Completely revised and updated, Hazardous Materials Compliance for Public Research Organizations: A Case Study, Second Edition presents a case study of one university ' s policies and practices with regard to the procurement, use, storage and disposal of HAZMAT in the context of a changing internal structure and regulatory environment. The author ' s presentation is no-holds-barred, using interviews, archival documentation, and unobtrusive observations as a participant where the research institution was at times noncompliant with the new federal guidelines. See What ' s New in the Second Edition: Incorporates issues with all types of hazardous materials instead of just focusing on biological HAZMAT Updated information on current regulations on HAZMAT in relation to universities and research centers Follow-up on the case study university, disclosing the university ' s progress in resolving the security and safety shortcomings By implementing key improvements in safety and security, the universities can also more easily obtain research grant money and satisfy both state and federal safety requirements. This book includes recommendations to improve safety while using and storing biotoxins, chemical, radioactive material, and industrial waste, and to improve overall security at the university. It also highlights improvements that can make the environment a safer and more secure location to perform biological research.

This research effort developed a modification to the HAZMAT program so that the program could provide the user with the capability to generate an estimate during the concept exploration and design phases for the total costs associated with hazardous materials usage in a major weapon system. Using the HAZMAT database, a spreadsheet was developed which projects a cost for a weapon system based on its total surface area and the number of aircraft to be produced by performing an analogy with a similar weapon system. The modification uses algorithm which are based on the hazardous material substances rather than processes which use hazardous materials. This enables the user to eliminate various substances entirely from the weapon system rather than trying to identify every process which uses a particular substance. The modification was identified to be the most efficient method of calculating an estimate during the early phases of the life cycle through in depth interviews and analysis of existing literature on the subject. The authors feel that the methods discovered in this thesis will provide insight for future revisions of HAZMAT and new attempts to formulate a life cycle cost model for hazardous materials.

An accomplished author with decades of experience working in the plastics industry and teaching the chemistry of hazardous materials to emergency responders, Frank Fire has updated his book covering the basic approach to hazardous materials. In the new third edition, each chapter has been revised (where required) to reflect changes since the second edition was published. For example, each chemical mentioned whose volume or usage has changed has been updated, including their usage as a chemical warfare agent. A new chapter covers each class of chemical warfare agents. An excellent resource for emergency responders and those involved in departmental training programs or curriculum development.
