The importance of metals in biology, the environment and medicine has become increasingly evident over the last twenty five years. The study of the multiple roles of metal ions in biological systems, the rapidly expanding interface between inorganic chemistry and biology constitutes the subject called Biological

Get Free Introduction To Inorganic Chemistry.

The present text, written by a biochemist, with a long career experience in the field (particularly iron and copper) presents an introduction to this exciting and dynamic field. The book begins with introductory chapters, which together constitute an overview of the concepts, both chemical and biological,

Get Free Introduction To

which are required to equip the reader for the detailed analysis which follows. Pathways of metal assimilation, storage and transport, as well as metal homeostasis are dealt with next.

Thereafter, individual chapters discuss the roles of sodium and potassium, magnesium, calcium, zinc, iron, copper, nickel and

conveniently and conventionally divided into two great groups, the animals and the plants. Broadly speaking the important feature which

distinguishes plants is that they can manufacture most of the substances they require by trapping and using various forms of outside energy, in particular the energy of sunlight. In the

Get Free Introduction To

process of photosynthesis they utilize the energy of light to build up complex chemical substances from relatively simple ones. In contrast, animals lack the ability to use light or any other form of outside energy. Instead they must obtain the energy they require by breaking down complex substances which ultimately they always

Get Free Introduction To

obtain from plants. Plant-eating animals such as cows and sheep obtain these substances directly.

Carnivores obtain them indirectly after they have passed through the bodies of other animals.

Alexander Todd, the 1957 Nobel laureate in chemistry is credited with the statement: “ where there is life, there is

Get Free Introduction To phosphorus” . Phosphorus chemical biology underlies most of life ' s reactions and processes, from the

covalent bonds that hold
RNA and DNA together,
to the making and
spending 75 kg of ATP
every day, required to
run almost all metabolic
and mechanical events in
cells. Authored by a
renowned biochemist,
