localization, content translation is often the very first thought that comes to our minds.

The second thought is “We need a robust and efficient database model to store translated content in multiple languages”.

Suppose we are asked to design a data model for a multilingual e-commerce application.

Unified Modeling Language (UML) plays a big role in software development, but also in non-software systems throughout many industries, as it's a way to visually show the behavior and structure of a system or a process. UML helps showcase potential errors in application structures, system behavior and other business processes. Why UML?

Database design is the organization of data according to a database model. The designer determines what data must be stored and how the data elements interrelate. With this information, they can

begin to fit the data to

the database model.

Database management system manages the data accordingly.

Database design involves classifying data and identifying interrelationships. This theoretical

representation of the data is called an ontology. The ontology is the theory behind the database's design.
