Connect the white (neutral) wire to the center or silver screw. Connect the remaining wires black and red which will both be "hot" wires to each of the top two screws on the outlet (brass or gold colored). Three wires: Using the screwdriver, connect the green/bare wire to the green screw on the bottom of the outlet.

These two "hot" wires deliver the 120 volts twice for a total of 240 volts. These wires are then connected to a two-pole breaker at the circuit panel in your breaker box – basically just two 120v single-pole breakers wired together. This is more complicated than 120v wiring and is best left to the professionals.

Typically a 240 volt heater will have three wires in a junction box or connection area. A dedicated circuit containing 3 wires, two will be the 240 volt lines and one will be the ground wire. The circuit size is determined by the required electrical load of the heater which is measured in watts or amps.
