These partial charges are stationary with respect to the mass of the atom. But molecular dynamics simulations can explicitly model polarizability with the introduction of induced dipoles through different methods, such as Drude particles or fluctuating charges. This allows for a dynamic redistribution of charge between atoms which responds to the local chemical environment.

more quickly in simulation, or making the simulation reach all low-energy conformational states more quickly. - For example, one might apply artificial forces to pull a drug molecule off a protein, or push the simulation away from states it has already visited. - Each of these methods is effective in certain specific cases.131

Molecular dynamics (MD) is a form of computer simulation wherein atoms and molecules are allowed to interact for a period of time under known laws of physics, giving a view of the motion of the atoms.Because molecular systems generally consist of a vast number of particles, it is impossible to find the properties of such complex systems analytically; MD simulation circumvents this problem by ...
